

# Climate Change in Bloomington

Emma Struss, Sustainability Coordinator

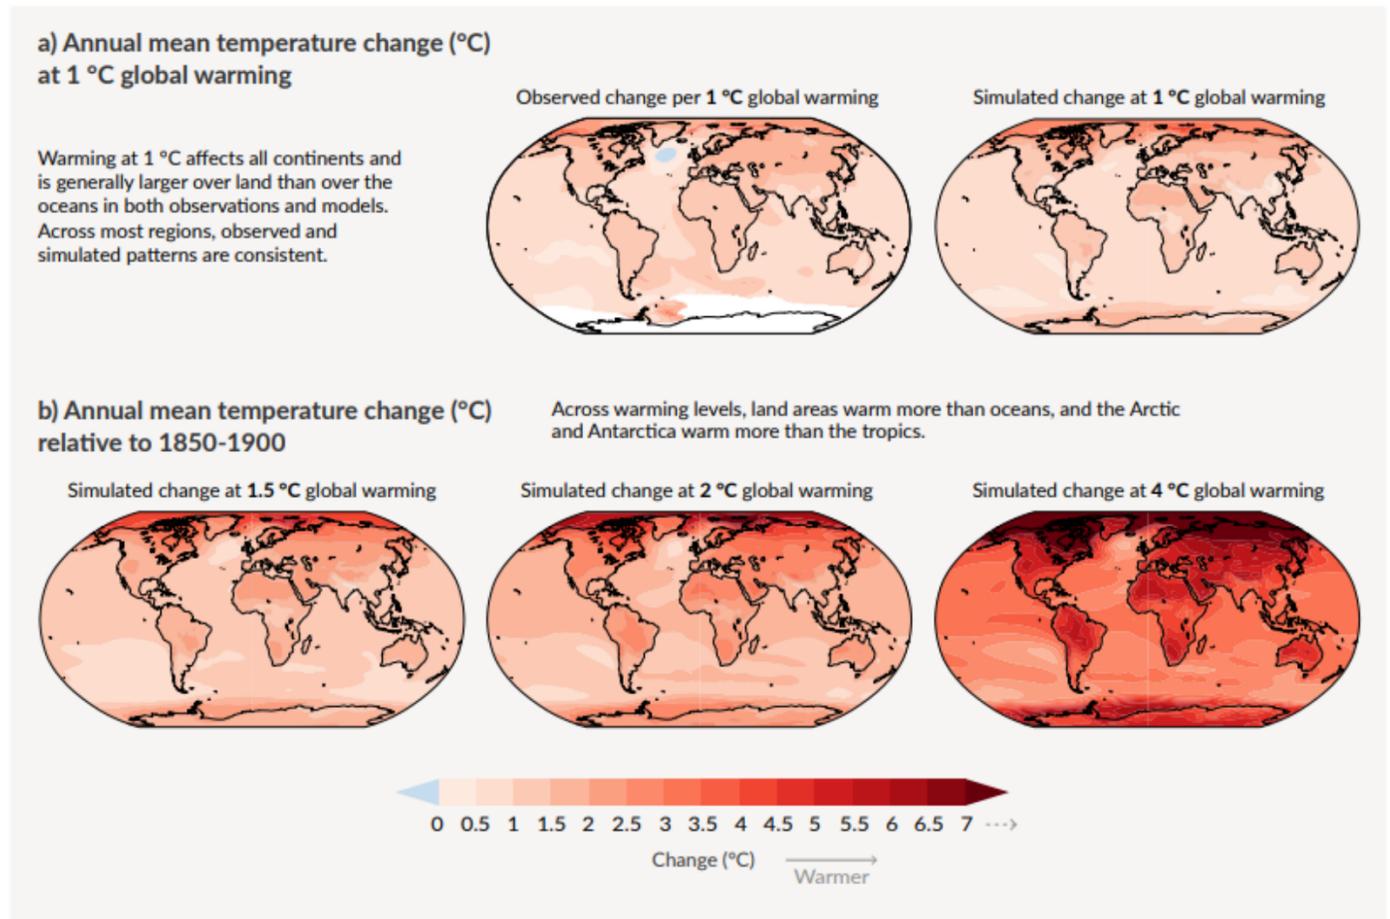

**Minnesota is  
warming  
faster than  
other states.**

- "Global surface temperature will continue to increase until at least the mid-century under all emissions scenarios considered."
- "Unless there are immediate, rapid and large-scale reductions in greenhouse gas emissions, limiting warming to close to 1.5 degrees Celsius or even 2 degrees Celsius will be beyond reach,"

**With every increment of global warming, changes get larger in regional mean temperature, precipitation and soil moisture**

RESOLUTION NO. 2017- 98

A RESOLUTION IN SUPPORT OF THE PARIS AGREEMENT

WHEREAS, the City Council of the City of Bloomington is the official governing body of the City of Bloomington, Minnesota; and

WHEREAS, the City Council of the City of Bloomington established a Sustainability Commission in 2016 to advance policies, practices, procedures, and proposals that relate to the sustainable use and management resources that include air, water, energy, land and ecological resources, and waste; and

WHEREAS, consensus exists among the world's leading climate scientists that global warming caused by emissions of greenhouse gases (GHG) from human activities is among the most significant problems facing the world today; and

WHEREAS, documented impacts of global warming include but are not limited to increased occurrences of extreme weather events (e.g. droughts and floods) and adverse impacts on ecosystems, public health, property, infrastructure, populations displacement and economic value chains; and

WHEREAS, the Paris Agreement resulted in a commitment from almost every nation to take action and enact programs to limit global temperature increase to less than 2 degrees Celsius, with an expectation that this goal would be reduced to 1.5 degrees in the future; and

WHEREAS, in signing the Paris Agreement, the United States committed that by 2025 it would reduce its carbon emissions by 26% - 28% below its 2005 levels; and

WHEREAS the Bloomington Sustainability Commission voted on August 15, 2017, to recommend the City Council adopt this resolution.

NOW, THEREFORE, BE IT RESOLVED BY THE CITY COUNCIL OF THE CITY OF BLOOMINGTON, MINNESOTA that:

1. The City of Bloomington supports the Paris Agreement; and
2. The City of Bloomington intends to demonstrate its commitment to reducing GHG emissions through an implementation of a Climate Action Plan to be developed before 2020; and
3. The City of Bloomington joins other U.S. cities in the Climate Mayors network (also known as Mayors National Climate Action Agenda) in adopting and working towards achieving, at a minimum, the goals of the Paris Agreement; and
4. The City of Bloomington commits to exploring the potential benefits and costs of adopting policies and programs that promote the long-term goal of GHG emissions reduction while maximizing economic and social co-benefits of such action.

Passed and adopted this 28<sup>th</sup> day of August 2017.

  
Mayor

Attest:   
Secretary to the Council

To limit warming to 1.5 degrees Celsius, carbon emissions must be halved by 2030 (from 2005 levels).

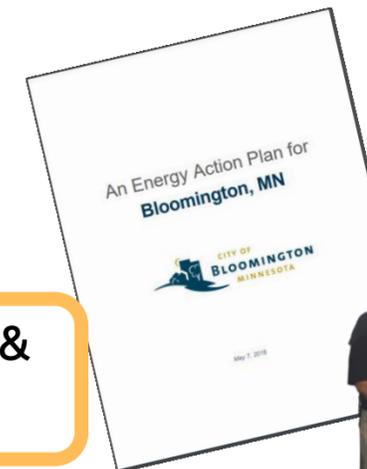

- Sustainability Commission formed.
- Council passed resolution in support of the Paris Agreement.

# 2018

- Council adopted Energy Action Plan & first city-wide GHG reduction goals.

- Full-time recycling, organics, and solid waste staff member hired.

- Full-time sustainability coordinator hired.
- City started receiving annual energy data from both utilities.

Category	2018	2019	2020	2021
Electricity	1,200,000	1,300,000	1,400,000	1,500,000
Gas	500,000	550,000	600,000	650,000
Water	100,000	110,000	120,000	130,000
Wastewater	100,000	110,000	120,000	130,000
Total	1,900,000	2,060,000	2,220,000	2,380,000

# 2019

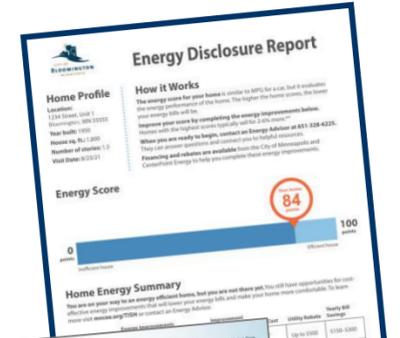

- City completed recommended upgrades from 2018 municipal facility energy efficiency study.
- City started researching connections between equity and climate change.

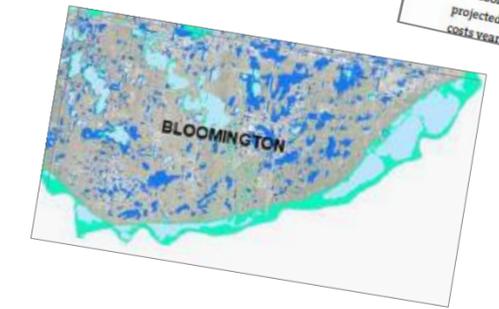

# 2020

- City Council adopted two energy disclosure ordinances, Time of Sale Energy Disclosure and Large Building Benchmarking.
- City completed research project on staff commuting habits.

# 2021

# Largest sources of greenhouse gas emissions in Bloomington

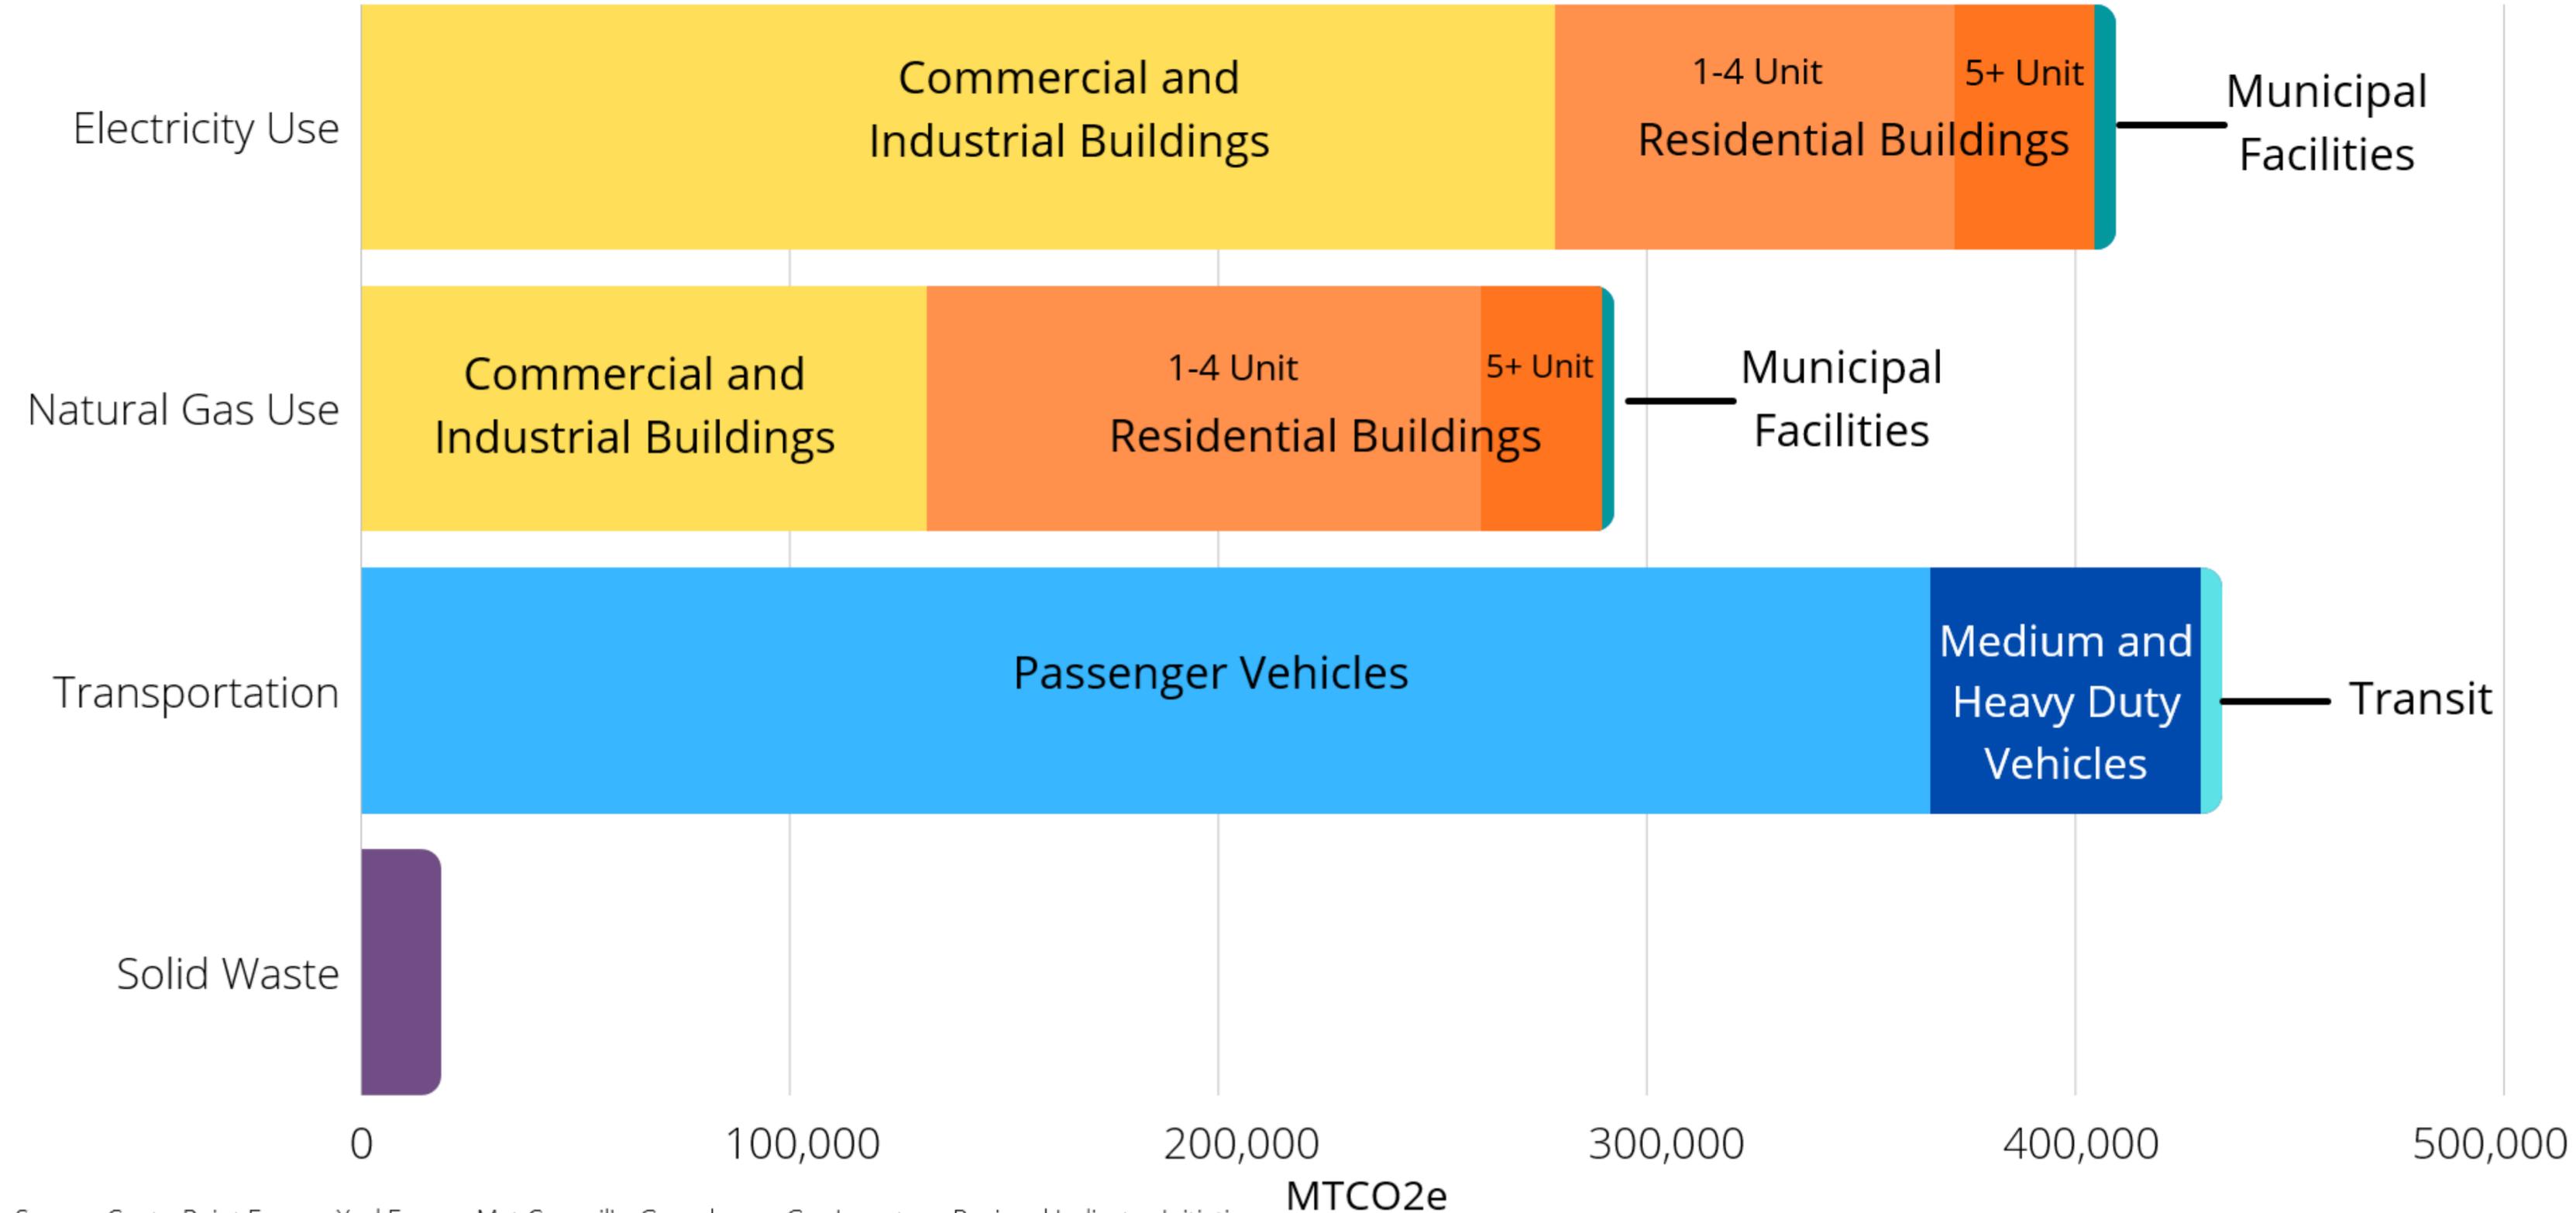

## Energy

Using natural gas and electricity in buildings

## Transportation

Driving passenger, medium, and heavy duty vehicles

# Sources of Bloomington's Greenhouse Gas Emissions

## Energy Benchmarking

### Let's Talk Sustainability

**OUR CHANGING CLIMATE**  
 Bloomington's climate is changing. This change comes from an increase in greenhouse gases in the earth's atmosphere. These gases trap the sun's heat, which bring problematic weather trends to our city like more extreme rain events, warmer winters, and an increased likelihood of extreme summer heat.

**THE ROLE OF BUILDINGS**  
 The buildings in our community play a big role in driving this change—the electricity and natural gas used to fuel them are the largest source of greenhouse gas emissions in the city. Conserving energy is an important way to fight climate change.

**FIRE STATION 4**  
 The biggest opportunity to prevent energy waste is by designing a building to be energy efficient. The City is doing this at Fire Station 4 by examining the best equipment and systems to use. Key parts of the building engineers and architects look at are include:

- HVAC: Heating, Ventilation, and Air Conditioning System
- Lighting
- Building Envelope
- Water Heating
- Appliances

**THE RESULT**  
 In 2020 the City spent \$2.6 million on energy. Preventing energy waste at Fire Station 4 is in line with the City's sustainability efforts, and saves money. This frees up resources for other City needs.

# Transportation is the largest source of GHG emissions in Minnesota.

- Transportation emissions increased by 30.5% since 1990.
- VMT in Minnesota in 2018 was 60.4 billion up over 44% since 1992 while population grew only at 26%.

## Section 4 • Transportation Element

### 4.1 Introduction

Bloomington's transportation mission is to facilitate movement of people and goods safely, efficiently, cost effectively, and comfortably to desired destinations while minimizing negative impacts on community livability and the environment. To accomplish that, the City strives to provide a multi-modal transportation network comprised of roadways, transit, walkways and bikeways, and rail facilities that support the needs of residents, businesses, and visitors.

Bloomington is near fully developed and the existing roadway network is essentially complete. Thus, the primary transportation planning focus is not on building new roads, but on reviewing, managing, and improving the existing transportation system to accommodate a broader spectrum of users and improve coordination with new development. This involves addressing street capacity, closing gaps in the pedestrian and cyclist system, enhancing transit facilities and services in areas with higher densities and employment, increasing safety, and cost effectively maintaining transportation assets.

#### Bloomington Transportation History

Until the mid-1800s, Minnesota's primary transportation corridors were rivers. Native Americans traveled, settled, and traded along the Minnesota, Mississippi, and other area rivers for centuries. The first European explorers and settlers also relied primarily on the rivers. Early activity centers such as Fort Snelling, St. Paul, and Shakopee were sited based on their river accessibility. To augment river transportation between these early activity centers, overland trails were laid out. One of Bloomington's first roads originated as the trail connecting Fort Snelling with Shakopee, commonly referred to as the Shakopee Road. Today's Old Shakopee Road generally follows the alignment of the original trail.

As white settlers began farming the area in the 1850s it became necessary to build

#### Significant Transportation Projects Completed in the Last Decade

Over the last decade several significant transportation projects were completed, in addition to numerous safety and capacity improvements throughout the City, including:

- Diverging Diamond Interchange at 34th Avenue and I-494
- Conversion of the at-grade crossing at US Hwy 41 Highway
- Linden Lane extension and streetscape enhancements
- South Loop ITS Wayfinding System
- Minnesota-Missouri River Regional Trail
- Old Cedar Avenue Bridge Rehabilitation
- School Crossing Safety Enhancement Projects
- Hybrid Trail Project
- 44th Street Widening

2019

Forward 2040

# City Ordinances

The purpose of Transportation Demand Management (TDM) is to promote more efficient utilization of existing transportation facilities, reduce traffic congestion and mobile source pollution, and to ensure that new developments are designed in ways to maximize the potential for alternative transportation usage. TDM is a combination of services, incentives, facilities and actions that reduce single occupancy vehicle (SOV) trips to help relieve traffic congestion, allow parking flexibility and reduce air pollution.

2009

§ 21.301.09  
TRANSPORTATION  
DEMAND  
MANAGEMENT (TDM)

(a) Purpose. To accommodate and promote electric vehicle charging throughout the city promoting the health, safety and general welfare of the community and preventing adverse impacts in the installation and use of electric vehicle chargers.

2019

§ 21.302.14 ELECTRIC  
VEHICLE CHARGING  
STANDARDS

a) Purpose and intent. The city recognizes the health, safety, welfare and aesthetic value of providing parking standards in the community. The provisions of this section are intended to:  
*(Note: it lists 11 items)*

2019

§ 21.301.06  
PARKING AND  
LOADING

(h) Shared vehicles. that are not rented or loaned are prohibited from the right-of-way and subject to removal by the city unless located in a dock or designated area. Commercial providers must obtain an obstruction permit for docked or dockless subject to the requirements of this section and following conditions of approval.

2020

UPDATE TO:  
§ 17.68 PERMIT  
REQUIRED.

# Climate Goals

There are no quantitative goals for reducing transportation-related greenhouse gas emissions, VMT reduction, electrification, etc.

# Goals

## Energy

75% reduction in city-wide energy-related greenhouse gas emissions by 2035, relative to 2016 levels.

## Transportation

Pursue all viable opportunities for promoting the elimination of vehicle emissions, including support for electric vehicles, increased public transportation, higher-density and mixed-use zoning, additional biking and pedestrian infrastructure, and telecommuting.

### An Energy Action Plan for **Bloomington, MN**

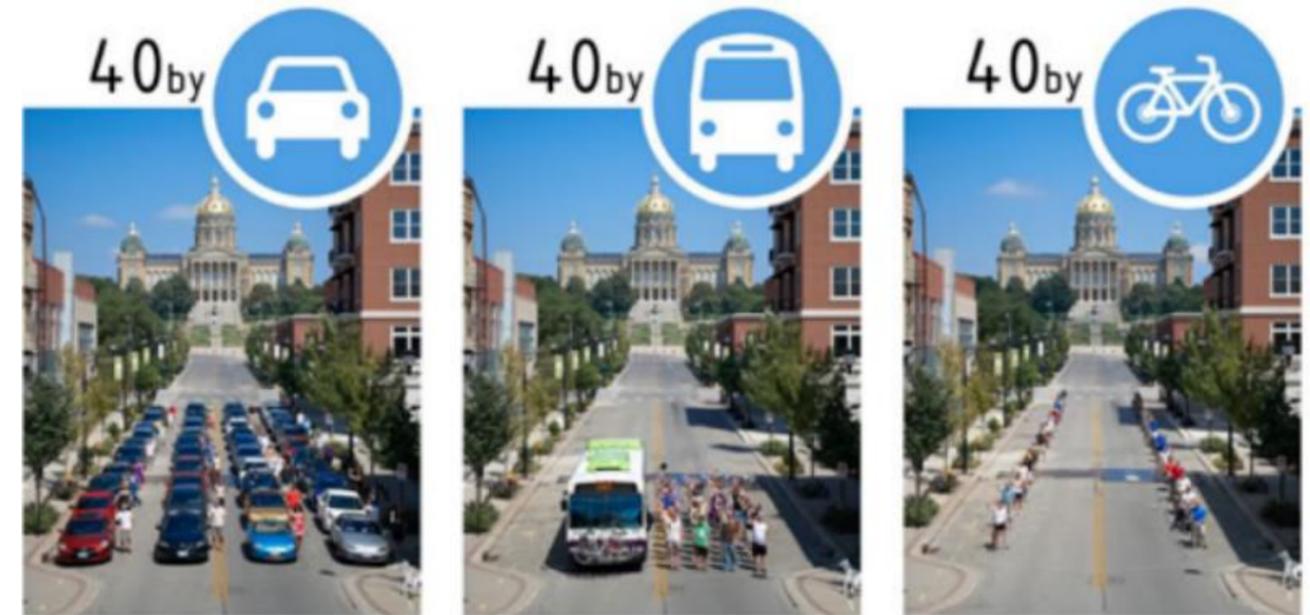

May 7, 2018

# Electrification

# Providing Alternatives to Driving Alone

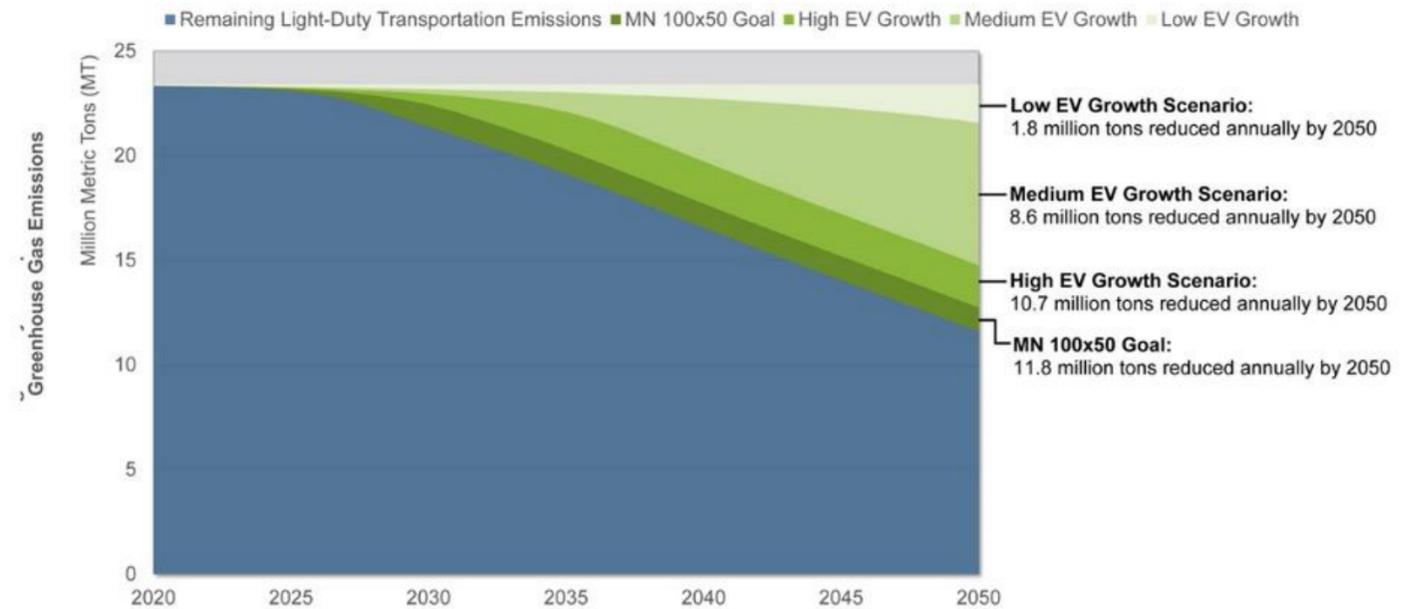

Amount of space required to transport the same number of passengers by car, bus, or bicycle.

(Des Moines, Iowa - August 2010)

Both electric vehicles and increasing low-carbon transportation options are needed.

## Annual Emissions Reductions by EV Sales Growth Scenario under Minnesota Average Grid Mix

Source: Modeled greenhouse gas emission reduction at various degrees of EV adoption, calculated by the Great Plains Institute. Scenario EV sales forecasts are based on both historic sales trends and the "Annual Energy Outlook 2020 | Table 2. Energy Consumption by Sector and Source," US Energy Information Administration, <https://www.eia.gov/outlooks/aeo/data/browser/#/?id=2-AEO2020&cases=ref2020&sourcekey=0>, which forecasts electricity consumption in the transportation sector.

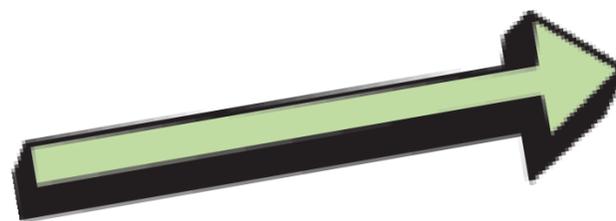

# Health

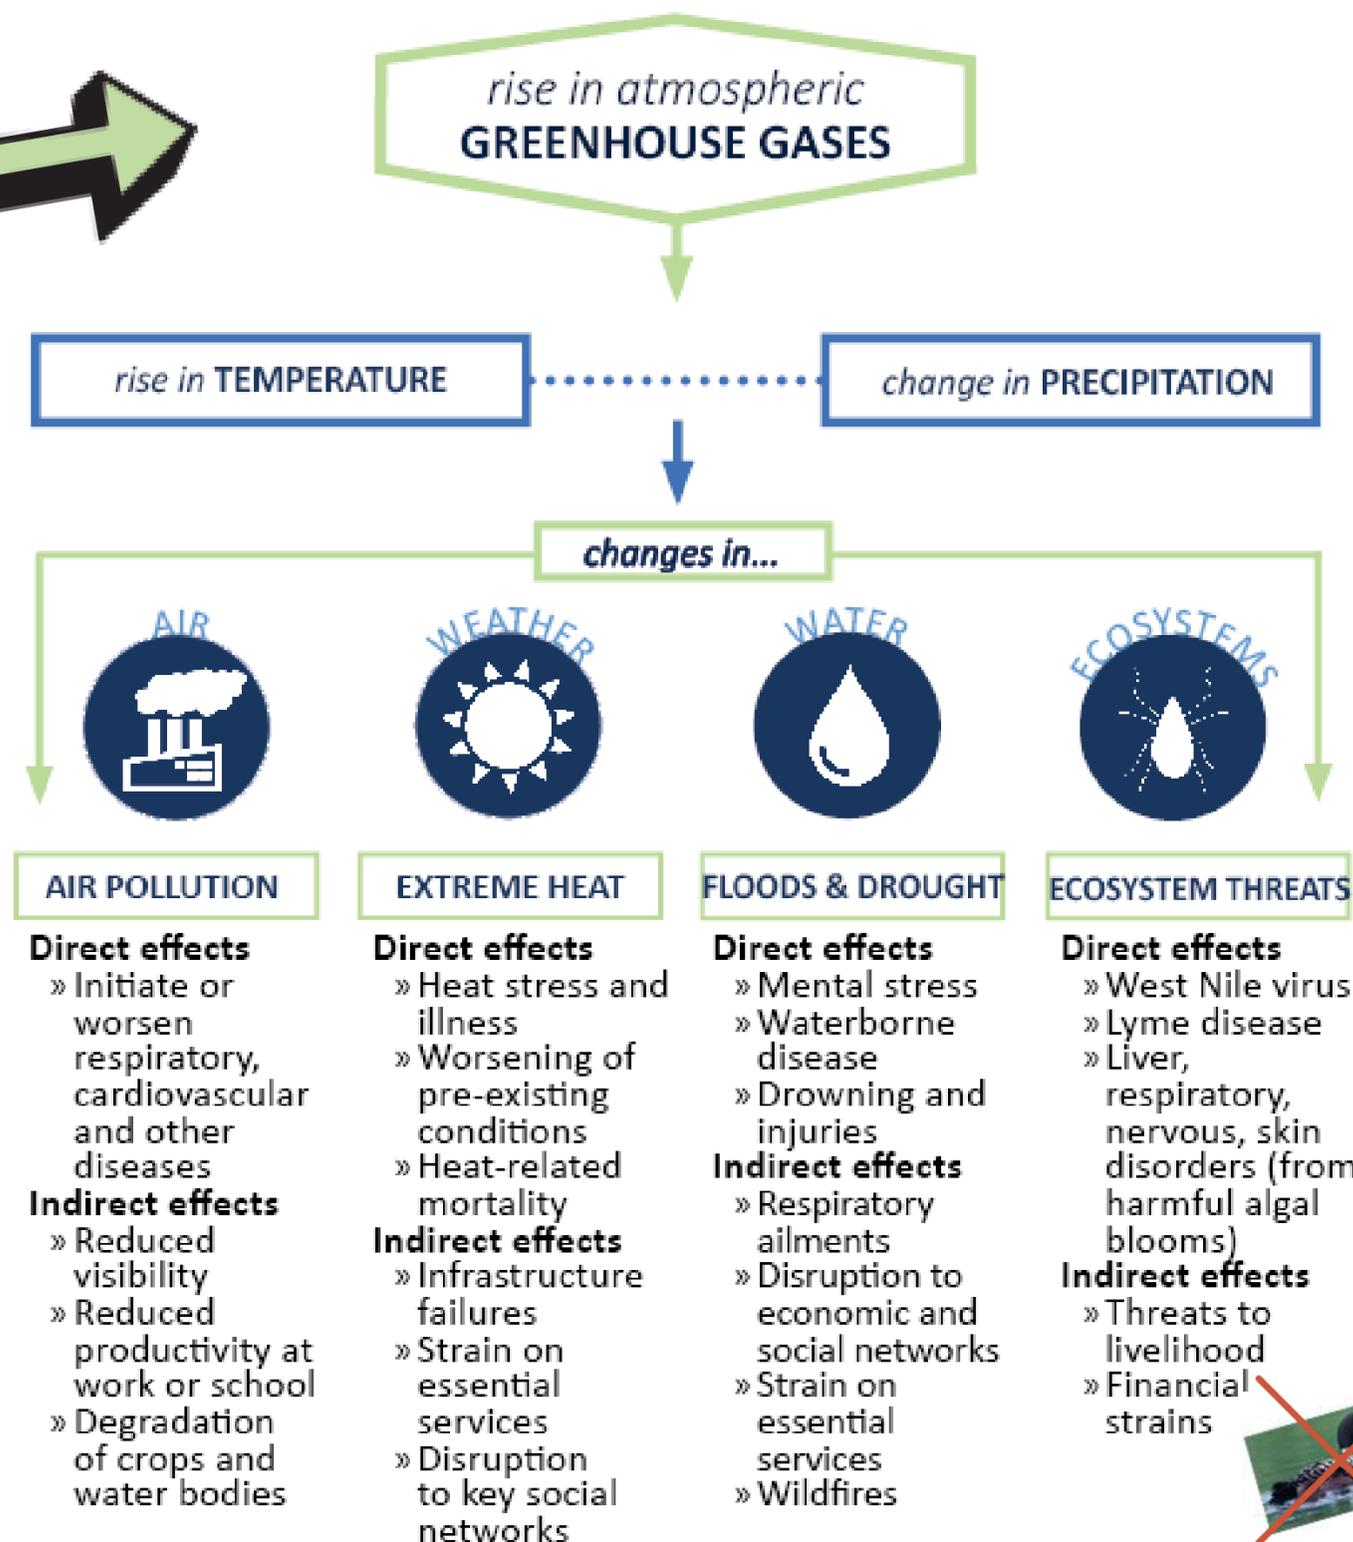

Using Energy

Driving

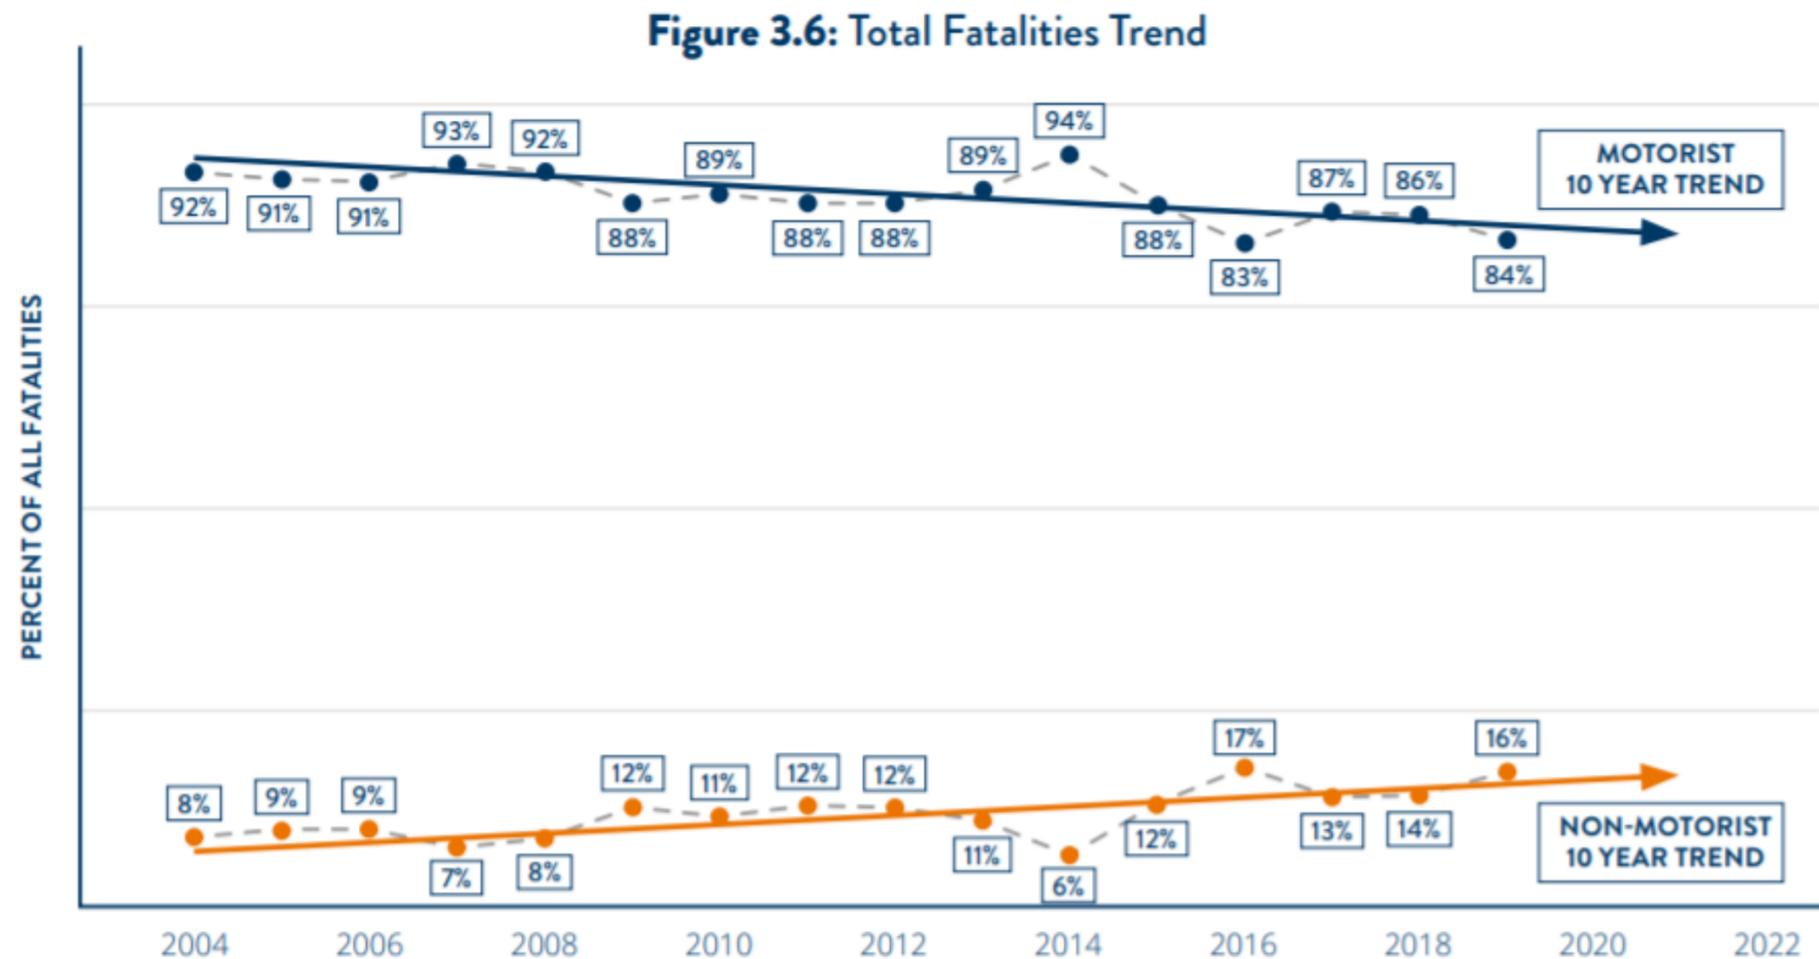

## CHANGES IN OUR ATMOSPHERE LEAD TO HEALTH EFFECTS

## State-wide

- The share of motorist traffic fatalities is trending down, while the share of non-motorist traffic fatalities is trending up.

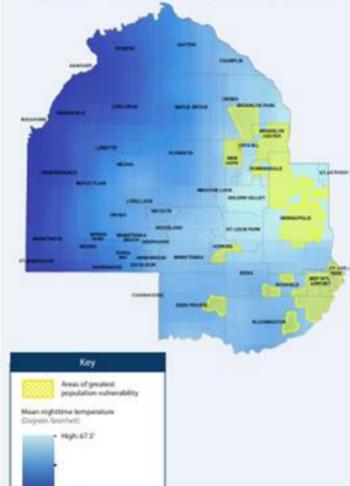

# Equity

## Extreme heat

Increased temperatures combined with increased humidity will disproportionately affect residents with underlying health conditions, especially those with limited means to adapt.

Figure 6: Heat Island – August Nighttime

## Urban heat islands and vulnerable communities

Many urban areas have more concrete and other impermeable surfaces that radiate heat along with less tree canopy and greenspace to mitigate the heat. This creates urban heat islands where the temperature measured can be significantly higher than the official reported temperature. The continued rise of temperatures due to climate change is likely worsening this heat island effect.

Occurrences of daytime extreme heat are projected to increase by 2050. While a couple of degrees may not seem significant, increased temperatures combined with increased humidity will disproportionately affect residents with underlying health conditions, especially those with limited means to adapt.

Areas with those most vulnerable to the effects of extreme temperatures and the urban heat island are shown in the map (Figure 6). The map was developed using average August nighttime mean temperatures from August 2011 to August 2014, which was derived from a study by the University of Minnesota<sup>11</sup>, overlain with the areas of greatest population vulnerability. Nighttime temperatures are an important factor because our bodies are evolved to cool down

## Extreme Heat

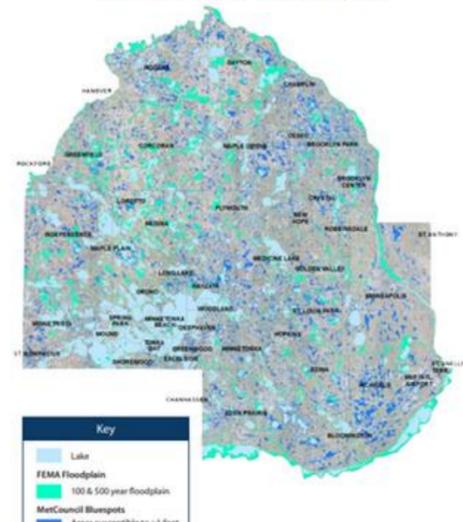

Urban areas with less tree canopy and greenspace and more impervious surfaces that radiate heat create heat islands

## Increased stormwater and localized flooding

Surface water impacts are determined by how much and how quickly precipitation falls and by the ability of soils to infiltrate water or the capability of stormwater conveyance systems to drain it away.

This map (Figure 9) depicts the location of 100-year and 500-year floodplains as mapped by FEMA. A 100-year flood is more accurately defined as a flood that has a 1% probability of occurring in any one year. Due to increasing precipitation, the 500-year floodplain is rapidly becoming the new 100-year floodplain. While many FEMA maps take into account storm sewer capacity and soil types, the mapping doesn't present a full picture because it doesn't consider localized flooding. The Minnesota Department of Natural Resources is working to

Figure 9: Areas susceptible to flooding

## Flooding

The eastern side of Bloomington has a higher percentage of BIPOC residents and has more areas susceptible to >1 ft of flooding

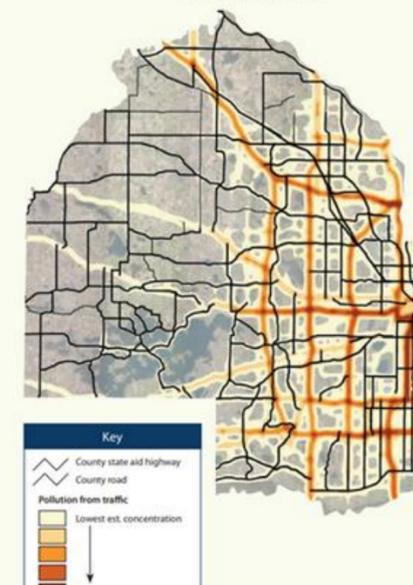

## Inequitable climate impacts: Air pollution from transportation

Vehicles are a large source of air pollution. The map (Figure 11) depicts a projection of air pollution from traffic based on average daily trip data.<sup>11</sup> As would be anticipated, transportation-related air pollution is higher in the more urban areas of the county where the road network is dense and traffic is highest. According to the Minnesota Pollution Control Agency, communities of color bear a disproportionate burden of traffic-related health impacts<sup>12</sup> due to living in proximity to the highest traffic levels.

According to the Minnesota Department of Transportation, reducing VMT will have immediate, lasting benefits to communities of color who breathe worse air and are at a higher risk of traffic crashes. Lowering VMT will help reduce both particulate matter and other pollutant emissions and reduce the risk of traffic crashes, resulting in improved, equitable outcomes.<sup>11</sup>

<sup>11</sup> Minnesota Department of Health, Healthy Communities Count! Indicators of Community Health along the Central Corridor Light Rail Transit

Figure 11: Projection of air pollution from traffic based on average daily trips.

## Air Pollution

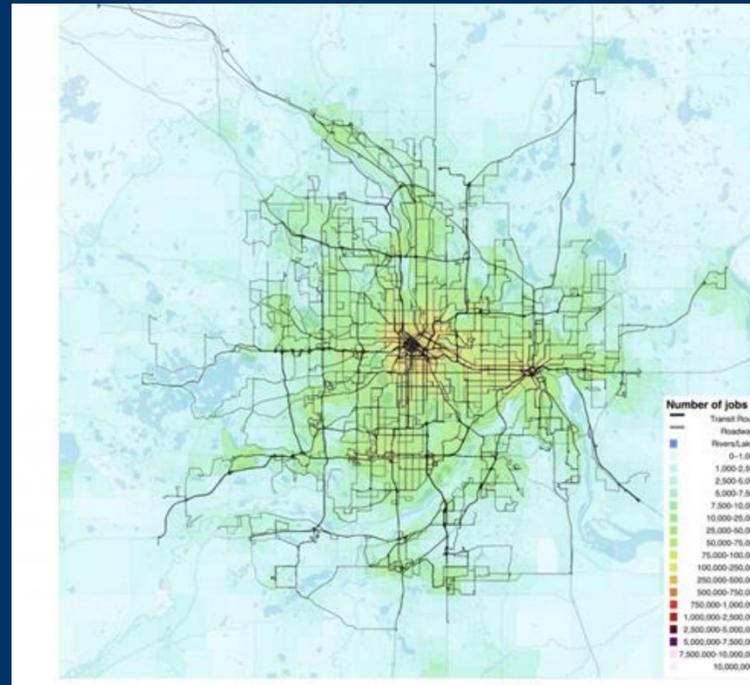

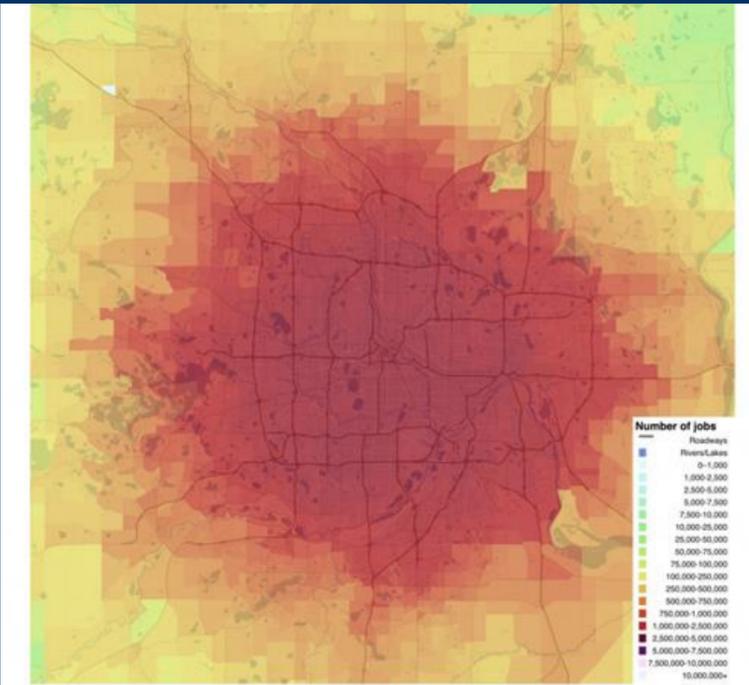

Vehicles are a large source of air pollution

## Quality of life

- Community Severance
- Noise Pollution
- Decreased Property Values

# Equity

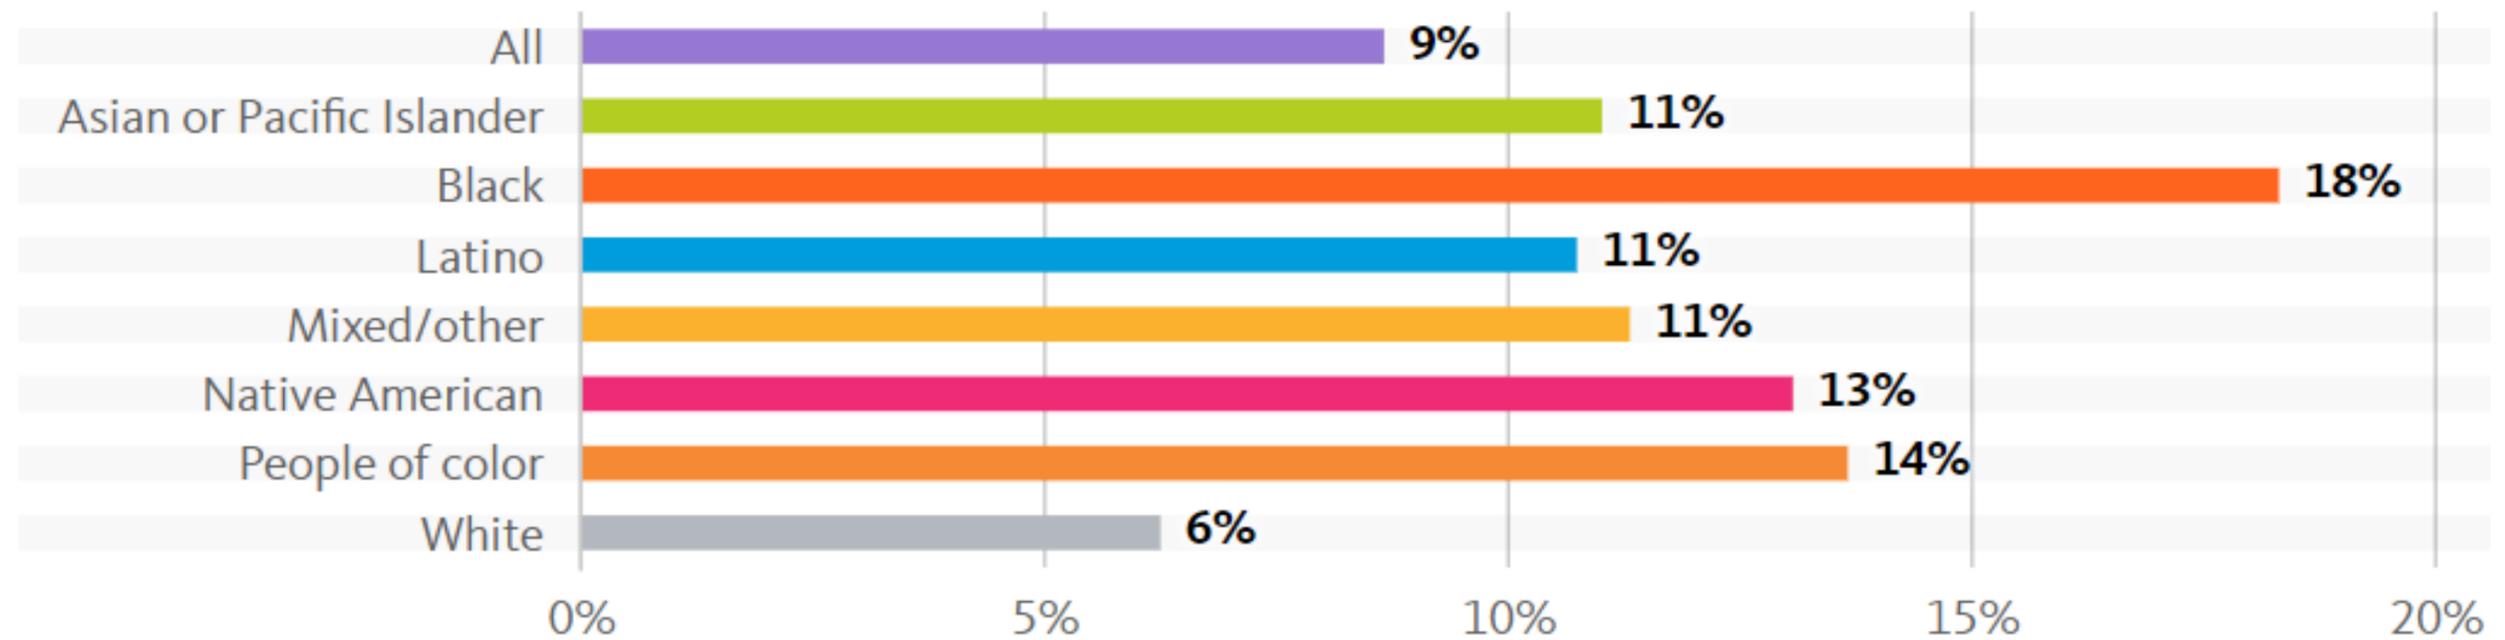

Access to  
Opportunity

Automobile job accessibility within 30-minutes of travel in the Minneapolis-Saint Paul metropolitan area is much greater than walk-up transit job accessibility within 30-minutes of travel in the Minneapolis-Saint Paul metropolitan area.

40% of  
Minnesotans  
don't have access  
to a car or can't  
drive

# Equity

Percent of households without a vehicle by race/ethnicity: United States, 2019

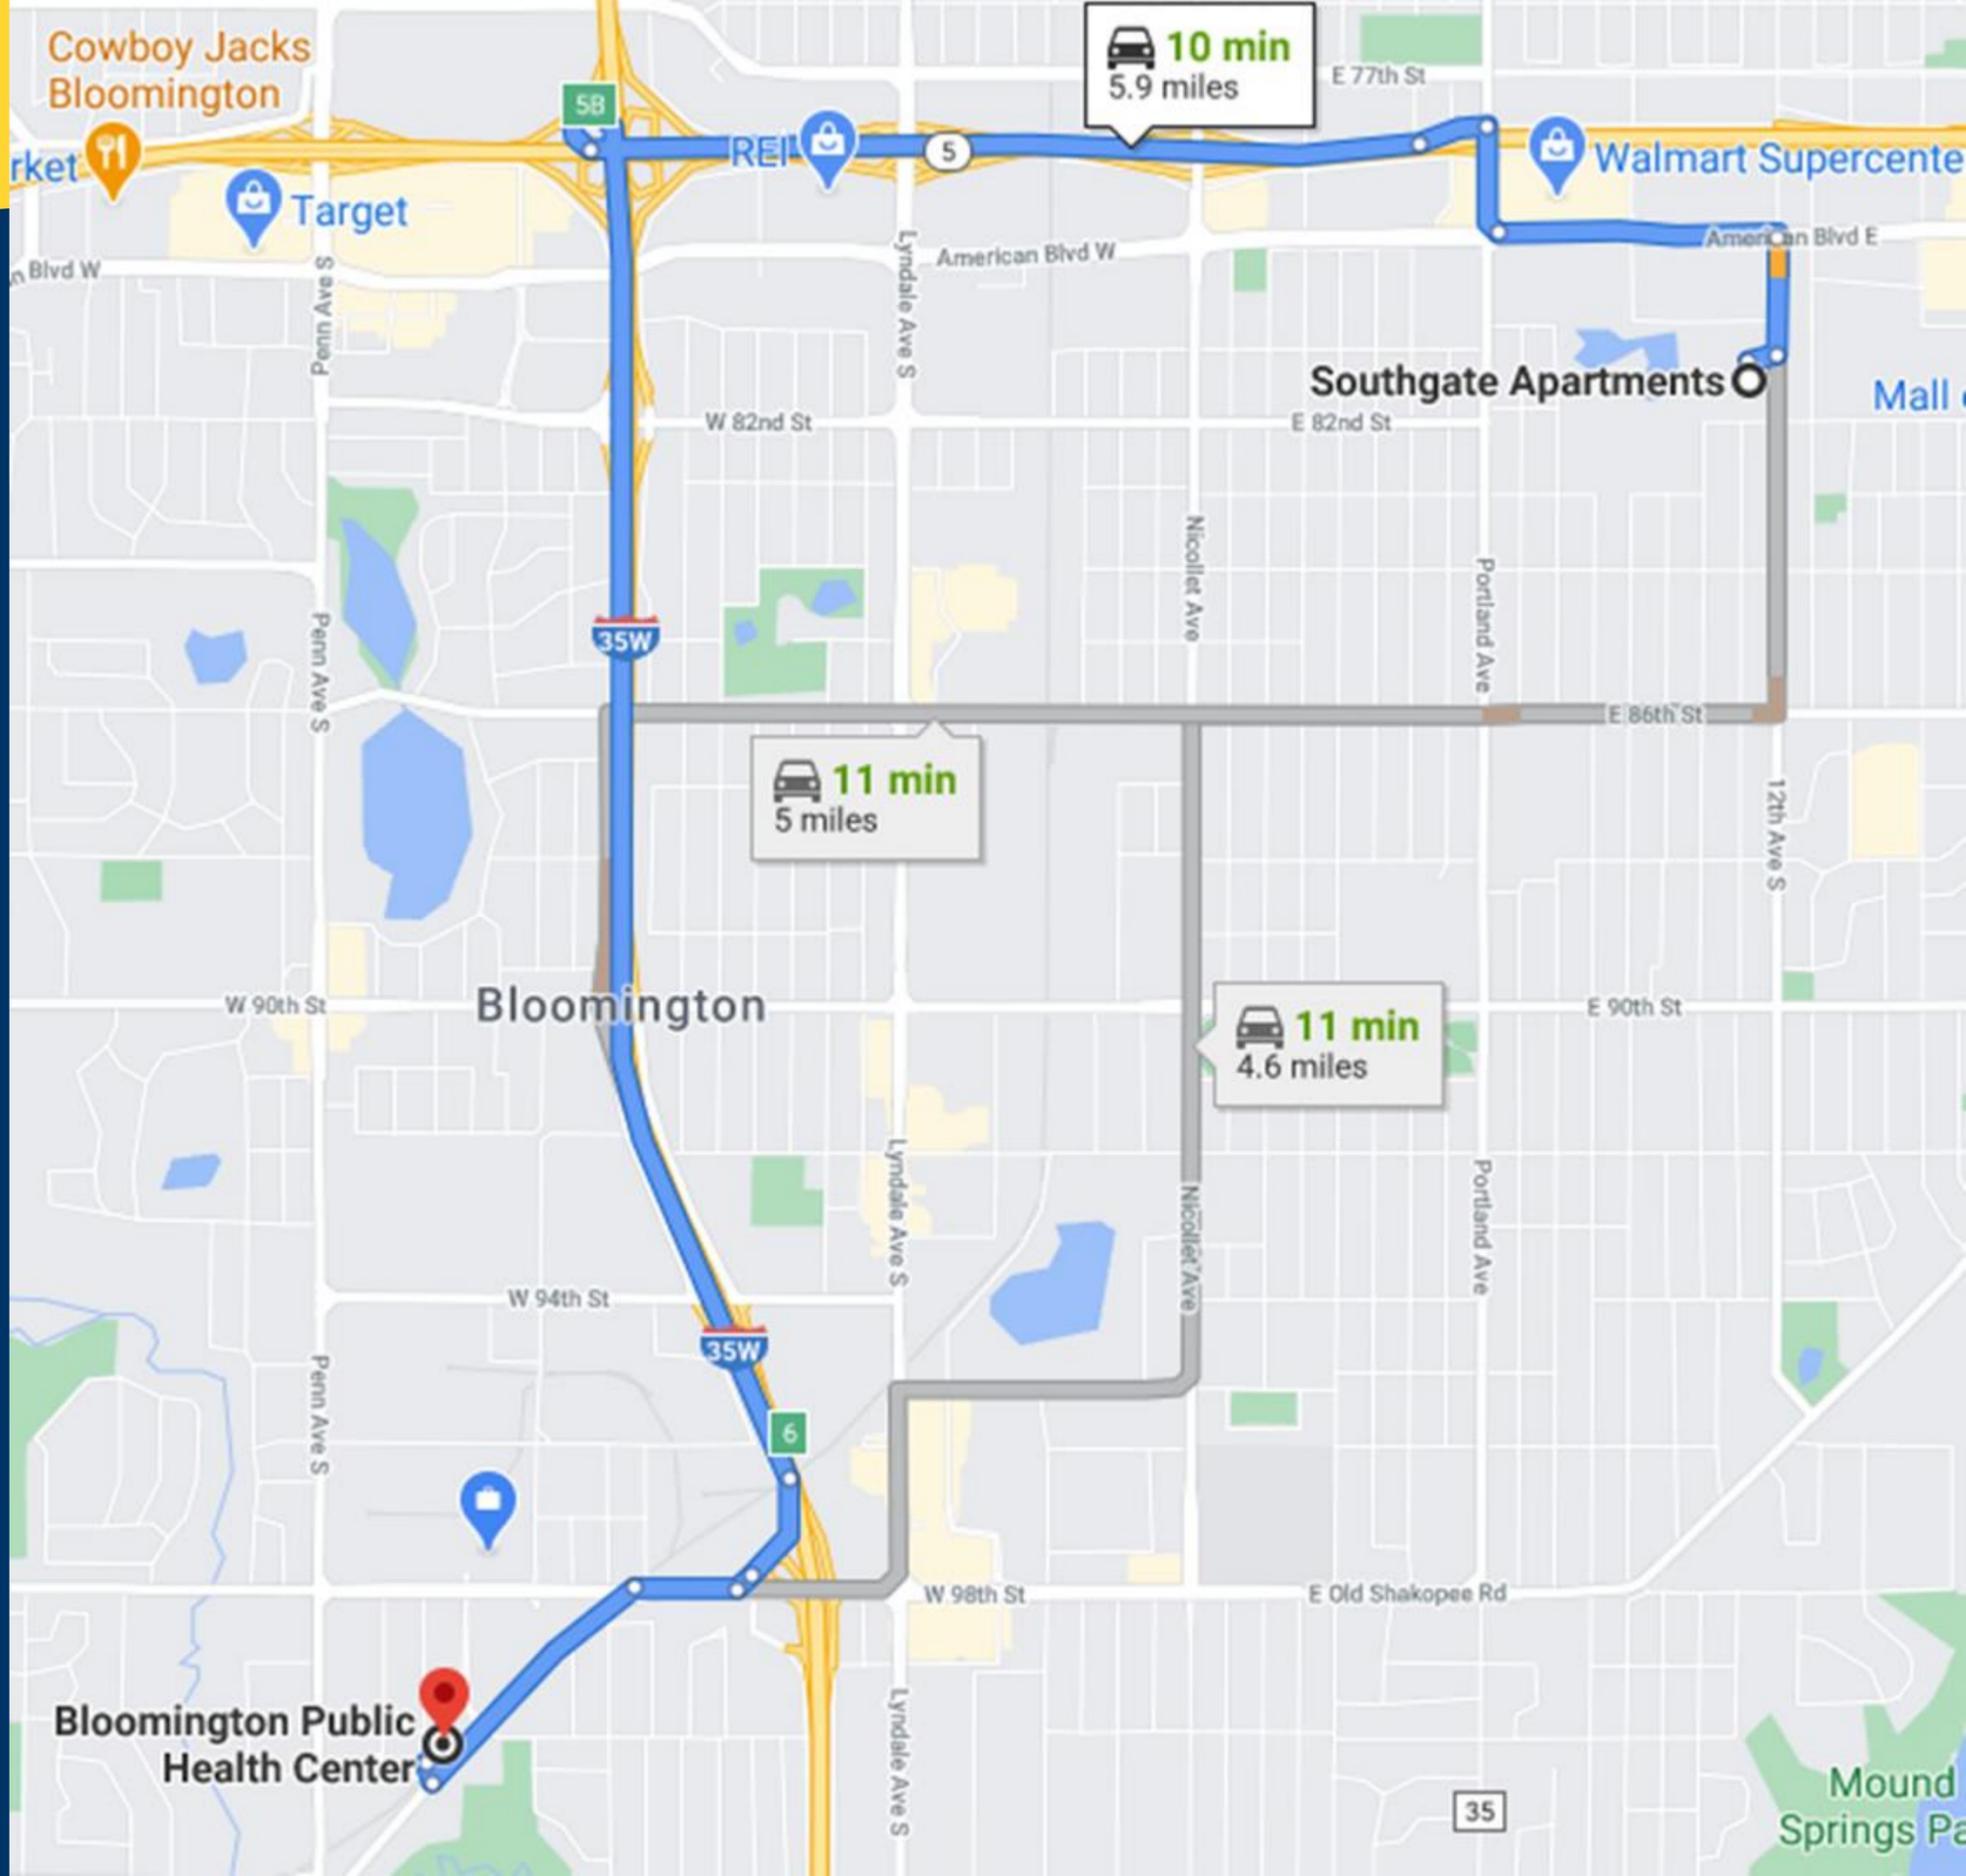

In most communities, convenient and reliable transportation access requires a vehicle

Black households are least likely to have access to a vehicle

TRANSPORTATION LISTENING SESSION  
SUMMER 2021

# Take Aways

Climate change is a significant health and equity problem that requires immediate action.

Energy use and driving contribute to this problem the most in Bloomington.

We are not on track to avoid the worst of climate change.

# Take Aways Cont.

Coordinated city-wide efforts to tackle this problem are in their infancy.

Sustainability efforts need to ramp up quickly in order to meet the City's climate goals.

There are solutions and resources to help us tackle this problem.

Questions?
